

## Experiment 10: Docker Files

### Aim :

To understand Docker Architecture and Container Life Cycle, install Docker and execute docker commands to manage images and interact with Containers.

### Theory :

Docker is a platform designed to make it easier to create, deploy, and run applications by using containers. Containers allow a developer to package up an application with all parts it needs, such as libraries and other dependencies, and ship it all out as one package. Here's a detailed look at the basics of Docker:

#### 1. What is Docker?

Docker is an open-source platform that automates the deployment of applications inside lightweight, portable containers. A container is a standard unit of software that packages up code and all its dependencies so the application runs quickly and reliably from one computing environment to another.

---

#### 2. Key Concepts in Docker

##### Containers

- **Definition:** Containers are isolated environments where applications run with everything they need to function.
- **Features:** They are lightweight, fast, and share the host OS kernel, making them more efficient than virtual machines.

##### Images

- **Definition:** An image is a read-only template used to create containers. It includes the application code, libraries, and other dependencies.

- **How it works:** You build an image, then run a container based on that image.

### Docker Engine

- The core component of Docker that runs and manages containers.
- It has two main parts:
  - **Server:** A long-running daemon process (**dockerd**) that manages containers.
  - **Client:** The command-line interface (**docker**) that users interact with.

### Docker Hub & Registry

- **Docker Hub:** A cloud-based registry service where Docker images are stored and shared.
  - **Registry:** A service for storing and distributing Docker images. Docker Hub is the default registry, but you can set up private registries.
- 

## 3. How Docker Works

- **Dockerfile:** A script that contains instructions to assemble a Docker image. It defines the base image, application code, and dependencies.
  - **Building Images:** Using the command **docker build**, Docker reads the Dockerfile and creates an image.
  - **Running Containers:** Using **docker run**, Docker starts a container from an image.
- 

## 4. Why Use Docker?

- **Portability:** Containers can run on any system that has Docker installed, regardless of the underlying hardware or OS.
- **Consistency:** The application runs the same way in development, testing, and production environments.

- **Isolation:** Each container is isolated from others, preventing conflicts between applications.
  - **Efficiency:** Containers are lightweight, using fewer resources compared to virtual machines.
- 

## 5. Basic Docker Commands

- `docker --version`: Check Docker version.
  - `docker pull <image>`: Download an image from Docker Hub.
  - `docker build -t <name> .`: Build an image from a Dockerfile.
  - `docker run <image>`: Run a container from an image.
  - `docker ps`: List running containers.
  - `docker ps -a`: List all containers (including stopped ones).
  - `docker stop <container_id>`: Stop a running container.
  - `docker rm <container_id>`: Remove a container.
  - `docker rmi <image_name>`: Remove an image.
- 

## 6. Docker Compose

- A tool for defining and running multi-container Docker applications.
  - Uses a YAML file (`docker-compose.yml`) to configure services, networks, and volumes.
  - Command: `docker-compose up` to start all services defined in the file.
- 

## 7. Real-World Use Cases

- **Microservices Architecture:** Running different microservices in isolated containers.
- **Continuous Integration/Continuous Deployment (CI/CD):** Automating testing and deployment processes.
- **DevOps and Infrastructure as Code:** Simplifying the deployment of complex applications.

## Output :

```

/d/MiscRepos/sepm_lab/files git:(master)±9 (0.675s)

Welcome to nginx!

## Welcome to nginx!

If you see this page, the nginx web server is successfully installed and working. Further configuration is required.

For online documentation and support please refer to [nginx.org](https://nginx.org).  
Commercial support is available at [nginx.com](https://nginx.com).

*Thank you for using nginx.*

```

## Conclusion :

Docker revolutionizes the software development and deployment process by providing a powerful platform for containerization. By encapsulating applications and their dependencies into lightweight, portable containers.
